

ABSTRACT OF THE DISCLOSURE

A window covering cord holder that suspends window covering cords a safe distance above the reach of infants and small children. The holder includes first and second cooperating members, at least one of which carries decorative matter that is visible at a substantial distance from the window covering. The first and second members are easily placed about and grippingly engage proximal and distal portions of a catenary loop of a window covering cord whereby the height of the loop may be easily adjusted to a desired elevation above the floor.
